Taikan Introduces the 3GHz Splitter

Lawrence, Kansas (February 6, 2008)- A growing number of consumers are clamoring for more advanced video services from their local provider. As the demand for services such as Video On Demand increases, leading video service providers will be under growing pressure to increase their network capacity.

In recognition of growing consumer needs and feedback from its customers, Taikan Company has developed a 3GHz splitter applicable for satellite or hybrid fiber coax networks. The new 2 way splitter is manufactured with a zinc alloy die cast housing and demonstrates superior isolation return loss for return path.

The recently introduced product will compliment Taikan's existing family of satellite splitters (2GHz 2 and 4 way splitters). The new 2 way splitter's model number is: DS2GWM, and additional splitters models are in development.

Visit www.taikan.com for additional information about this new product.
